

## Release note

### Asset selection for Schedulings

#### Release date: 10 July 2013

To-date, when creating an **archive** Scheduling for a Title in Movidia the most recent Asset was automatically selected for the Scheduling.

To give you flexibility in how you manage your VoD workflow with Movidia, a new configuration option is available that results in **no Asset** being selected when Schedulings are created. This provides you with complete control over which Asset is selected for a Scheduling. Please note that this change does **not** affect **catch-up** Schedulings.

This note describes what has changed in full, and as usual you can contact **support** or your technical account manager for further clarification; please note that automatic Asset selection is **enabled** by default.

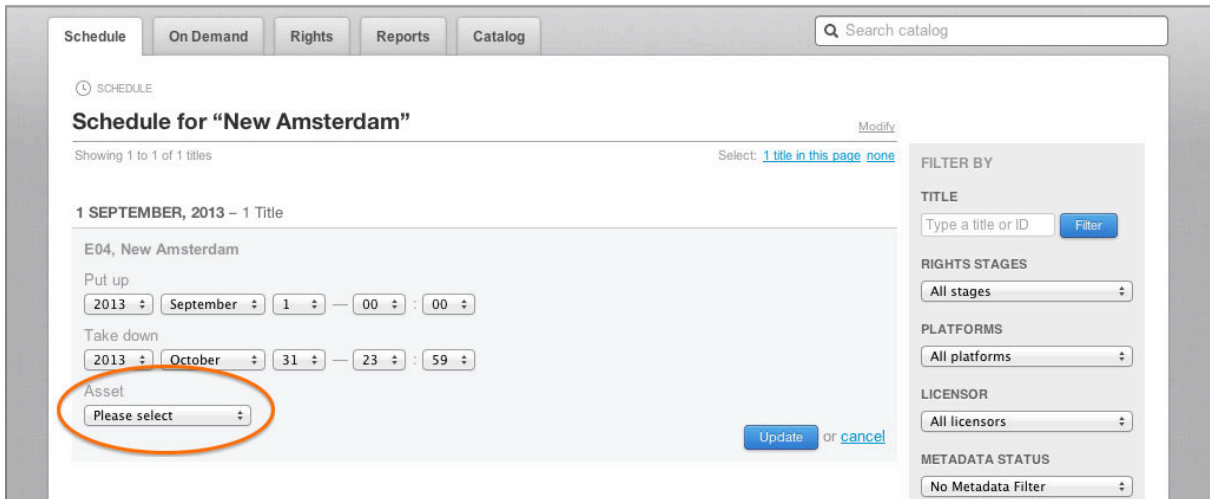

#### BeBanjo reference(s)

Application	Issue	Title
movidia	1255	Implement setting to configure Asset selection for schedulings

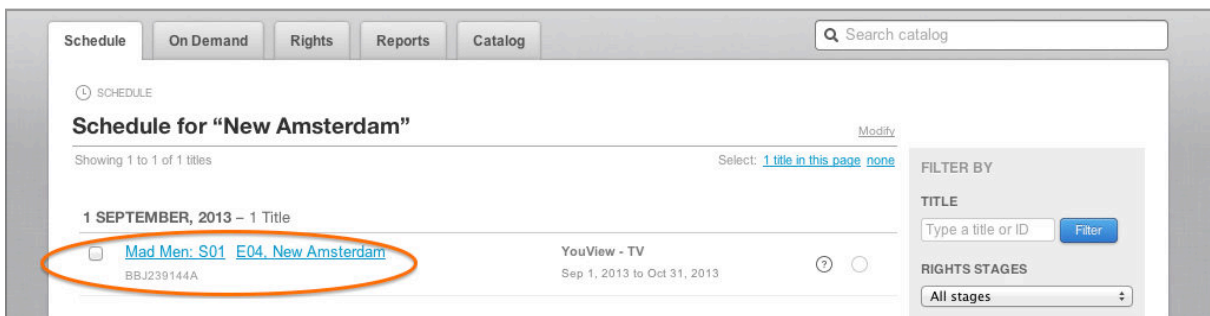

Assuming that automatic Asset selection has been **disabled**, this is what a new Scheduling for a Title looks like:

Notice how an Asset hasn't been automatically selected by MoviDa. To select the appropriate Asset you need to click the Edit option, that appears when you mouse-over the Scheduling, to show these options:

The Asset drop-down will show all of the Assets for the Title, along with the "Create a new asset..." option. When you have selected, or created, an Asset it is locked to the Scheduling:

If a new Asset is subsequently created for the Title it will **not** automatically change which Asset is selected for the Scheduling.
